# Successful Static Splinting

Forearm Based Splint Fabrication,  
Part 2

Dr. Kirsten Davin  
OTD, OTR/L, ATP, SMS

continued

## Copyright/Permissions

- All images, charts, graphs, photos and other assets in this PowerPoint are owned by Dr. Kirsten Davin and/or she has secured written permission to publish them on continued.com.
- A special thank you to Performance Health, who provided images, charts and graphs for our educational purposes.

## Disclosures

- Presenter Disclosure:
  - Financial: Kirsten Davin has received an honorarium for presenting this course.
  - Non-financial: Kirsten Davin has no relevant non-financial relationships to disclose.
- Content Disclosure: This learning event does not focus exclusively on any specific product or service.
- Sponsor Disclosure: This course is presented by OccupationalTherapy.com.

## Learning Outcomes

After this course, participants will be able to:

- Describe a volar versus dorsal-based approach to splint fabrication, while considering sheet, pre-cut and pre-formed methods of application.
- List the steps involved in selecting, fabricating, and modifying the following splints: thumb spica, wrist cock-up, functional position, and intrinsic plus.
- Describe the benefits of a forearm-based splint as compared to a hand-based design.

continued

## Materials Selection

### Preformed Splints

- Previously molded and sized to client based on a size chart
- Easily adjustable and reshaped via heat if needed
- Various thermoplastics available

**Q1**

continued

## Materials Selection

### Precut Splint Blanks

- Increased efficiency with fabrication
  - Reduced time cutting, sizing and fitting
- Preselected materials appropriate for anatomy and splint type
- Helpful for beginners

**Q2**

continued

continued

## Materials Selection

### Precut Splint Blanks with Perforation

- Increased airflow
- Reduced weight
- Beneficial for those with moisture/dampness under the splint (ie. dressing drainage, etc.)
- Available in various thermoplastics

continued

## Thermoplastic Characteristics

### Perforation

#### Solid versus Perforated

**Solid**  
Maximum support.

**Perforated**  
Perforated (1%, 2% or 2.5%) for slight ventilation and added comfort without compromising rigidity.  
**Tip:** Material softens quicker when heated.

**UltraPerf, OptiPerf, SuperPerf**  
UltraPerf (13%), OptiPerf (19%), Lightweight provides greater ventilation for increased comfort and compliance. SuperPerf (38% or 42%) for lighter weight, exceptional ventilation and greater comfort and compliance.

**Tip:** For additional support, select a thicker material, with higher perforations.

**Tip:** Higher perforations soften quicker when heated and soften quicker and cool faster when heated.

		
1/16" (1.6 mm) 13% UltraPerf	1/16" (1.6 mm) 19% OptiPerf	1/16" (1.6 mm) 42% SuperPerf
		
3/32" (2.4 mm) 19% OptiPerf	3/32" (2.4 mm) 38% SuperPerf	
		
1/8" (3.2 mm) 1% Perf	1/8" (3.2 mm) 19% OptiPerf	1/8" (3.2 mm) 42% Perf

continued

## Materials Selection

### Sheet Fabrication

- Increased flexibility in design
  - Helpful for the fabrication of non-traditional or specific splinting designs
- Often more cost efficient than pre-cut splint blanks

## Hand-based vs. Forearm-based

### Selection Considerations

- Intrinsic vs extrinsic muscular involvement
- Objective of the splint: safety? Immobilization?
- Client preference, comfort, and/or compliance

**Q3**

## Forearm Splint Design

Volar vs. Dorsal-based Design

## Overview of Splint Fabrication

- Determine - splint and pattern
- Decide - material and how to select
- Prepare - material
- Apply - patient
- Finish - trimming, edge finishing, strapping
- Assess - fit, make necessary modifications
- Instruct - care and wearing schedule

continued

## Splint Fabrication Goals

### Serial Static

- Maintain arches
- Contour to skin
- Maintain motion (if indicated)
- Permit balanced function of unaffected muscles
- Allow maximal mobility with optimal stability
- Allows for freedom of digits
- Minimal stretch for a longer period rather than quick correction
- Larger surface area to distribute pressure following the normal contours of the hand and arm

Q4/5 ■

continued

## Case Study #1: Mrs. K

### Thumb Spica

- 62 year-old female
- Recently started kayaking, 3-4 hrs./day, several times per week
- Diagnosis:
  - Thumb MP joint ligament strain
- Physician ordered a forearm-based thumb spica
- Actions:
  - Select thermoplastic and splint base design (ie. precut, preformed, etc.)

Q6/7 ■

continued

continued

## Forearm-based Thumb Spica

Case Study #1: Mrs. K

continued

## Forearm-based Thumb Spica

Case Study #1: Mrs. K

- Tips to Fabrication:
  - Use children's craft foam to create durable reusable patterns
  - Easy to test on the client's anatomy prior to cutting thermoplastics
  - May also use padding at the thumb IP or MP to protect skin integrity

Q8

continued

continued

## Case Study #2: Mrs. Q

### Volar or Dorsal Wrist Cock-Up

- 42 year-old female, legal assistant
- Typing at a computer/office work daily
- Diagnosis:
  - Numbness and tingling, productivity suffering due to need for frequent breaks due to discomfort
  - Increased discomfort upon waking, patient preferred more conservative treatment before considering surgery
- Physician ordered a wrist cock-up splint
- Actions:
  - Select thermoplastic and splint base design (ie. precut, preformed, etc)

Q9

continued

## Volar and/or Dorsal Wrist Cock-Up

### Case Study #2: Mrs. Q

- Determine the approach to splint fabrication for this client
  - Which approach would you choose?
  - Why?

Case Study #2: Mrs. Q

continued

## Case Study #3: Mr. O

Functional Position Splint w/ Intrinsic Plus Modification

- 72 year-old male, retired, but very active
- Golfs, fishes, plays with grandchildren
- Diagnosis:
  - At dinner last night, the patient experienced facial droop, right sided UE weakness
  - Admitted to ICU following diagnosis of stroke
- Physician ordered a functional position splint for right hand/wrist
- Actions:
  - Select thermoplastic and splint base design (ie. precut, preformed, etc)
